Newly constructed Stillman Pedestrian Bridge nearing completion

Construction of the new Stillman Pedestrian Bridge that crosses IH 37 near the Nueces Bay exit is wrapping up. The long-standing pedestrian bridge was demolished as part of the Harbor Bridge Project and has been under construction since last year. The newly constructed structure includes enhanced safety features with the addition of public entrances that span both the IH 37 main lanes and the frontage roads. The new bridge is expected to be open for public use by the end of March.

Progress evident in South Approach area of the project

A row of footings and columns have sprung up in the South Approach section of the project, which is located just Northeast of the current IH 37/SH 286 interchange and TC Ayers area of the city. Construction crews have been busy pile driving, while simultaneously constructing footings and columns. So far, 23 footings, 12 columns, and 12 pier caps have been completed in this area. The South Approach area spans approximately from the IH 37/SH 286 interchange to just north of the Whataburger Field parking lot.
